

Patient: Jean Felipe Pessoa Borges

Date of Birth: 08/11/1984

Gender: Male

Exam: Head Computed Tomography

Clinical Indication: The patient was referred for a head computed tomography to evaluate recurrent headaches.

Technique Used: The exam was performed with the patient in a supine position, using a TC Scanner Pro with 64 slices. No contrast was administered.

Radiological Findings:

- **Skull:** The skull appears intact, without evidence of fractures or bony lesions.
- **Brain:** No significant abnormalities were identified in the cerebral parenchyma. No hemorrhages, lesions, or anomalies were observed.
- **Paranasal Sinuses:** The paranasal sinuses appear unremarkable.

Diagnostic Impression: Based on the radiological findings, it is concluded that no significant abnormalities were identified in the head computed tomography. Clinical follow-up is recommended for evaluation and treatment of headaches.

Conclusion: This report was prepared based on the images obtained from the head computed tomography performed on the patient John Doe on 10/10/2023. We emphasize that this document is fictitious and does not represent a real diagnosis. It is recommended that any interpretation be done by a duly qualified healthcare professional.

Sincerely,

Dr. Joseph Rogers
